

Project Phase

Employee Issue Management System

Date	27 September 2026
Team ID	
Project Name	Employee Issue Management System
Maximum Marks	4 Marks

Employee Issue Management System:

In a large enterprise organization, employees frequently face workplace-related issues such as payroll discrepancies, access problems, infrastructure requests, and HR policy clarifications. The current email-based and informal communication process can result in non-standardized data capture, delayed resolution, limited status visibility, manual effort, and inconsistent prioritization and assignment.

The proposed ServiceNow solution provides a centralized way for employees to raise an **Employee Issue** through the Service Portal. A Record Producer is used instead of a direct table form so that employee input can be captured in a controlled and user-friendly way.

Objective:

To design and implement a production-ready ServiceNow Employee Issue Management solution that enables employees to submit workplace issues from the Service Portal while enforcing validations, dependencies, standardized data capture, and appropriate issue handling.

Skills Required:

Service Catalog Admin Tools HTML Application CSS Codes Client Script Portal Servers Developer Console

Mentor:

No mentor assigned yet

Project Statistics:

Total Epics	Total Tasks	Total Subtasks

Implementation Goal:

Enable employees to raise an Employee Issue from the Service Portal using a Record Producer; enforce validations and field dependencies consistently; and provide a structured foundation for assignment, prioritization, tracking, and resolution.

Step-1: Problem Statement and Solution Definition

Identify the limitations of email and informal issue reporting, define the Employee Issue process, and establish the ServiceNow components required for the solution.

Project Implementation

Employee Issue Management System

Step-2: Solution Components and Phase Planning

Phase 1: Creating a Custom Application

Create the custom ServiceNow application named **Employee Center** and configure it as a scoped application.

Phase 2: Creating a Custom Table and Fields

Create the **Employee Raise Issue** custom table and define the fields required to capture employee issue information in a standardized format.

Phase 3: Creating UI Policies and Dependencies

Configure UI Policies, Client Scripts, and field dependencies so that the form behaves consistently based on the employee's selected issue information.

Phase 4: Creating a Record Producer

Create a Service Catalog Record Producer that allows employees to submit an Employee Issue and maps the submitted variables to the custom Employee Raise Issue table.

Phase 5: Creating a New Service Portal

Create and configure a dedicated Service Portal through which employees can access the Employee Issue functionality.

Phase 6: Creating Widgets and Adding to the Page

Develop and configure Service Portal widgets using HTML/CSS and appropriate client-side logic, then add the widgets to the required portal page.

Phase 7: Testing and Validation

Test the complete employee issue submission flow, including mandatory fields, dependencies, Record Producer behavior, data creation, portal display, and validation scenarios.

Phase 8: Conclusion

Document the completed solution, its workflow, key configurations, validation behavior, and the improvements achieved through centralized issue management.

Step-3: Expected Outcome

The completed solution provides employees with a simple Service Portal experience for raising workplace issues while ensuring structured data capture and consistent validation. The solution also establishes a foundation for improved issue visibility, prioritization, assignment, and resolution by HR and support teams.

End-to-End Flow

Employee → Service Portal → Record Producer → Employee Raise Issue Table → Validation & Dependencies → Assignment/Prioritization → Issue Tracking → Resolution
