Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	13 October 2026 (documentation date)
Team ID	N/A — Individual project
Project Name	Employee Raise Issue Management System
Maximum Marks	4 Marks

Functional Requirements

Following are the functional requirements of the Employee Raise Issue Management System.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Employee Issue Submission	Submit an issue through the Service Portal using the “Raise an Issue” Record Producer.
		Capture requester, category, subcategory, state, and issue description through catalog variables.
FR-2	Issue Record Creation	Create an Employee Raise Issue record in the custom ServiceNow table after successful submission.
		Generate a unique issue number for each created record.
FR-3	Field Validation and Rules	Make the issue description/short description mandatory when the state is New, using a UI Policy.
		Keep the generated Number field read-only so users cannot change it manually.
FR-4	Category and Subcategory Selection	Allow users to select a category such as Network, Software, Hardware, or Access.
		Provide subcategory choices such as VPN, Laptop, Server, and Forgot password, associated with their category.
FR-5	Portal Navigation and User Experience	Display the Commercial Services and Raise an Issue widgets on the Employee Center portal page.
		Allow the Raise Ticket action to navigate to the Raise an Employee Issue Record Producer.
FR-6	Issue Details and Attachments	Allow the user to enter a description of the issue and add supporting attachments where the form permits.

Non-functional Requirements

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	**Usability**	The portal provides a clear, straightforward form with labelled fields and a visible Raise Ticket action to help employees submit issues.
NFR-2	**Security**	The application relies on ServiceNow platform authentication and configured access controls. Access should be restricted according to user roles and table permissions.
NFR-3	**Reliability**	The Record Producer maps submitted values to the custom issue table, while UI Policies and field configuration help maintain consistent data.
NFR-4	**Performance**	The solution uses native ServiceNow forms, catalog variables, and widgets without adding a separate application server or external processing service.
NFR-5	**Availability**	The portal depends on the availability of the ServiceNow instance and its platform services. No custom high-availability infrastructure was configured.
NFR-6	**Scalability**	The application uses a scoped ServiceNow table and platform-hosted portal. Capacity and scaling are managed by the ServiceNow platform; no custom microservices architecture was implemented.

Scope note: The requirements above reflect the current implementation and observed form behavior. Automated email/OTP confirmation, external integrations, SLA tracking, dashboards, and notification workflows are not listed as implemented because they were not part of the completed project steps.
